- (2024) Was dropped out from university (at my own request)

My covered topics: [link]

PROJECTS

- In July 2023, I developed the [MultiBot] software for the drop-hunting community [Cryptophilos], which processed transactions totaling $4.1M over the course of a year. [MultiBot] is a distribution bot that helps send any tokens from the OKX exchange to multiple accounts for airdrop execution.

- In September 2023, I co-founded my own company, [AT industries], with a friend, and we share our successes on our Telegram channel. In the first half of 2024, our team completed 18 different projects. Currently, the company employs 3 staff members. You can learn more about our journey from the [interview] on the "Bread and Bitcoin" channel.

- In January 2024, I developed software for running multiple accounts for the airdrop from project [Wormhole]. The software was used both by our team members and other purchasers. In total, 0.15% of the total W token supply were credited to all software users accounts.

- In May 2024, together with one of the employees from [STON.fi], I developed a bot that monitors a large number of Telegram channels dedicated to the TON community, generates its own posts based on this information and publishes them in the Telegram channel [TONlines].
